INTRODUCTION

For several years, Statistics Canada has been publishing a selection of seasonally-adjusted labour force statistics on an annual basis. This, the sixth edition of the publication, contains a much wider range of series than did the previous editions and has been designed to satisfy the expanding needs of the many users of labour force data.

The unadjusted statistics contained in this document are based on information obtained through a sample survey of households. Interviews are carried out in some 30,000 households chosen by area sampling methods across the country. The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out on a monthly basis. Estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month.

The sample used in these surveys of the labour force has been designed to represent all persons in the population 14 years of age and over residing in Canada, with the following exceptions: residents of the Yukon and Northwest Territories, Indians living on reserves, inmates of institutions, and members of the armed forces. These exclusions amount to about 3 per cent of the total population 14 years of age and over.

Estimates derived from a sample survey are subject to sampling and non-sampling errors. Aspects of this subject as well as definitions and explanations relating to the Labour Force Survey may be obtained by referring to the monthly publication "The Labour Force" (Statistics Canada, Catalogue No. 71-001). For a more detailed description of the survey, reference is made to "Canadian Labour Force Survey, Methodology" (Statistics Canada, Catalogue No. 71-504).

The series have been processed using the X-11 version of the United States Bureau of the Census Method II Seasonal Adjustment Computer Program(1).

Seasonally-adjusted labour force estimates may be obtained by direct adjustment or by summing seasonally-adjusted employment and seasonally-adjusted unemployment. The former method has been applied to data appearing in this publication for the sake of convenience; in other Statistics Canada reports on the labour force, the summation method has been used. For purposes of comparison, an appendix has been added to this publication showing the original and the seasonally-adjusted (by summation) data for the labour force for Canada by the main age/sex groups and the five regions.

Depuis un certain nombre d'années, Statistique Canada publie un recueil de statistiques annuelles désaisonnalisées sur la main-d'oeuvre. La présente édition est la sixième de cette série; elle comporte une gamme beaucoup plus étendue de statistiques que les livraisons précédentes et elle vise à répondre aux besoins croissants d'un grand nombre d'utilisateurs de données sur la main-d'oeuvre.

Les données non désaisonnalisées du présent bulletin sont fondées sur des renseignements obtenus au moyen d'une enquête fragmentaire faite auprès des ménages. Environ 30,000 ménages choisis par échantillonnage aréolaire dans tout le pays sont interviewés. L'enquête sur la main-d'oeuvre, inaugurée en novembre 1945, a été effectuée trimestriellement jusqu'en novembre 1952. Depuis lors, elle est effectuée tous les mois. Les estimations de l'emploi, du chômage et du nombre de personnes inactives portent sur une semaine déterminée chaque mois.

L'échantillon servant à l'enquête sur la main-d'oeuvre a été conçu de façon à représenter toutes les personnes âgées de 14 ans et plus qui habitent au Canada, exception faite des habitants du Yukon et des Territoires du Nord-Ouest, des Indiens des réserves, des pensionnaires des institutions et des militaires. Ces catégories exclues représentent environ 3 % de la population totale âgée de 14 ans et plus.

Les estimations tirées d'une enquête fragmentaire demeurent sujettes aux erreurs de sondage et aux erreurs non dues au sondage. Les différents aspects de cette question ainsi que les définitions et les explications relatives à l'enquête sur la main-d'oeuvre figurent dans la publication mensuelle intitulée La main-d'oeuvre, Statistique Canada, n° de catalogue 71-001F. Une description plus détaillée de l'enquête est faite dans le "Canadian Labour Force Survey, Methodology", Statistique Canada, n° de catalogue 71-504.

Les séries ont été traitées à l'aide de la version X-11 du United States Bureau of the Census Method II Seasonal Adjustment Computer Program(1).

Pour savoir quels sont les effectifs désaisonnalisés de la main-d'oeuvre, on peut procéder par ajustement direct ou par sommation de l'emploi désaisonné et du chômage désaisonné. Pour des raisons pratiques, c'est la première de ces méthodes qui a été appliquée aux données que l'on trouvera ici; dans d'autres publications de Statistique Canada sur la main-d'oeuvre on a fait appel à la seconde méthode en procédant par sommation. Pour permettre les comparaisons, on a fait suivre la présente publication d'un appendice indiquant les données initiales et les données désaisonnalisées (par sommation) concernant la main-d'oeuvre du Canada pour chacun des principaux groupes par sexe et par âge et pour les cinq régions.

Seasonally-adjusted unemployment rates are always calculated by dividing the seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and unemployment (i.e. seasonally-adjusted labour force by summation). Main series of unemployment rates, corresponding to the labour force series above, can also be found in the appendix.

For each data series included in the contents of this publication, four tables have been presented as indicated below:

1. The unadjusted data. All estimates derived from the Labour Force Survey are rounded to thousands.
2. The final seasonal factors. Included in this table are forecast factors for the coming year.
3. The final seasonally-adjusted series. This table is obtained by dividing the unadjusted data for each month by the respective final seasonal factor.
4. The MCD moving average. This table presents the data for an unweighted moving average of the final seasonally-adjusted series. The term of the MCD average is determined by the period of time (not exceeding 6 months) required in order that the change in the final seasonally-adjusted series have a larger cyclical component than irregular component. Thus the MCD moving average represents the cyclical component of a data series, whereas the final seasonally-adjusted series contains both the cyclical and the irregular components.

(1) For a description of the technique see U.S. Bureau of the Census Technical Paper No. 15, "The X-11 Variant of the Census Method II Seasonal Adjustment Program".

Pour le calcul de tous les taux de chômage désaisonnalisés, on divise le nombre désaisonnalisé des chômeurs par la somme de l'emploi et du chômage désaisonnalisés (qui représente la main-d'oeuvre désaisonnalisée obtenue par sommation). Les séries principales de taux de chômage correspondant aux séries sur la main-d'oeuvre dont il est question ci-dessus figurent également en annexe.

Pour chaque série de données présentée, dans le présent bulletin, on trouvera quatre tableaux disposés dans l'ordre suivant:

1. Les données non désaisonnalisées. Toutes les estimations extraites de l'enquête sur la main-d'oeuvre sont arrondies au millier.
2. Les facteurs finals de désaisonnalisation. Le tableau indique également les facteurs prévus pour l'année à venir.
3. La série finale de données désaisonnalisées. On obtient le tableau en divisant chaque mois les données non désaisonnalisées par le facteur saisonnier final correspondant.
4. La moyenne mobile du mois de dominance cyclique (M.D.C.). Dans ce tableau, on trouvera les données sur la moyenne mobile non pondérée de la série désaisonnalisée finale. La moyenne M.D.C. est déterminée en fonction de la période de temps (jusqu'à concurrence de 6 mois) qu'il faut pour que la variation de la série désaisonnalisée finale comporte un élément cyclique plus important que l'élément irrégulier. Dans une série de données, la moyenne mobile M.C.D. représente donc l'élément cyclique, alors que la série désaisonnalisée finale comporte aussi bien l'élément cyclique que l'élément irrégulier.

(1) On trouvera une description de la méthode en question dans le document suivant: U.S. Bureau of the Census Technical Paper No. 15, "The X-11 Variant of the Census Method II Seasonal Adjustment Program".

Prairies Total	264-265
British Columbia Total	"

- Notes: 1. These seasonally adjusted labour force series were obtained by summing the final seasonally adjusted series of employment and unemployment for each respective data series. The figures presented will differ slightly from those appearing on pages 12-17, 20-28, 31-39, 42, 44, 47, 50, 53 and 56, in which the labour force was seasonally adjusted by the direct method (see the introduction paragraph 6). The unadjusted data for each labour force series has also been shown on alternate pages for the convenience of the reader.
2. Unemployment, seasonally adjusted, as a percentage of the sum of seasonally adjusted employment and seasonally adjusted unemployment, for each respective data series.

Taux de chômage(2) — Fin

Féminin, Canada	258-259
Féminin 14-24 ans, Canada	"
Féminin 25 ans ou plus, Canada	260-261
Féminin 14-19 ans, Canada	"

Féminin 45 ans ou plus, Canada	262-263
Provinces de l'Atlantique	"
Québec	"
Ontario	"
Provinces des Prairies	264-265
Colombie-Britannique	"

- Nota: 1. Ces séries désaisonnalisées sur la main-d'oeuvre résultent de la sommation des séries désaisonnalisées finales sur l'emploi et le chômage pour chaque série de données. Les chiffres diffèrent quelque peu de ceux qui apparaissent aux pages 12 à 17, 20 à 28, 31 à 39, 42, 44, 47, 50, 53 et 56, car ces derniers ont été désaisonnalisés par ajustement direct (voir Introduction, alinéa 6). Les données non désaisonnalisées pour chaque série sur la main-d'oeuvre sont aussi données en regard pour accommoder le lecteur.
2. Le chômage désaisonnalisé, en tant que pourcentage de la somme de l'emploi et du chômage sésaisonnalisés pour chaque série de données.

- Notes: 1. These seasonally adjusted labour force series were obtained by summing the final seasonally adjusted series of employment and unemployment for each respective data series. The figures presented will differ slightly from those in which the labour force was seasonally adjusted by the direct method (see the Introduction). The unadjusted data for each labour force series has also been shown on alternate pages for the convenience of the reader.
2. Unemployment, seasonally adjusted, as a percentage of the sum of seasonally adjusted employment and seasonally adjusted unemployment, for each respective data series.

Taux de chômage(2) — Fin

Provinces des Prairies	34-35
Colombie-Britannique	"

- Nota: 1. Ces séries désaisonnalisées sur la main-d'oeuvre résultent de la sommation des séries désaisonnalisées finales sur l'emploi et le chômage pour chaque série de données. Les chiffres diffèrent quelque peu, car ces derniers ont été désaisonnalisés pour chaque série sur la main-d'oeuvre sont aussi données en regard pour accommoder le lecteur.
2. Le chômage désaisonnalisé, en tant que pourcentage de la somme de l'emploi et du chômage désaisonnalisés pour chaque série de données.

INTRODUCTION

For several years, Statistics Canada has been publishing a selection of seasonally-adjusted labour force statistics on an annual basis. In order to better serve the needs of users, this publication has been restructured and streamlined. Data series considered to be the most relevant are published in this edition, whereas, all other series published in the 1971 version, as well as other selected series which users have requested, will be published in a series of working papers. These will be sent to you shortly. The main changes from last year to note are: that labour force and unemployment rate series, derived by the summation method, now appear as Section 1; labour force and participation rate series, derived by direct adjustment, have been deleted and will be published as a separate working paper; and additional series added to the 1971 publication, as well as other requested series, will be published as working papers.

The unadjusted statistics contained in this document are based on information obtained through a sample survey of households. Interviews are carried out in some 30,000 households chosen by area sampling methods across the country. The Labour Force Survey, started in November 1945, was taken at quarterly intervals until November 1952. Since then it has been carried out on a monthly basis. Estimates of employment, unemployment and non-labour force activity refer to the specific week covered by the survey each month.

The sample used in these surveys of the labour force has been designed to represent all persons in the population 14 years of age and over residing in Canada, with the following exceptions: residents of the Yukon and Northwest Territories, Indians living on reserves, inmates of institutions, and members of the armed forces. These exclusions amount to about 3 per cent of the total population 14 years of age and over.

Estimates derived from a sample survey are subject to sampling and non-sampling errors. Aspects of this subject as well as definitions and explanations relating to the Labour Force Survey may be obtained by referring to the monthly publication "The Labour Force" (Statistics Canada, Catalogue No. 71-001). For a more detailed description of the survey, reference is made to "Canadian Labour Force Survey, Methodology" (Statistics Canada, Catalogue No. 71-504).

The series have been processed using the X-11 version of the United States Bureau of the Census Method II Seasonal Adjustment Computer Program(1).

Depuis un certain nombre d'années, Statistique Canada publie un recueil de statistiques annuelles désaisonnalisées sur la main-d'oeuvre. Afin de mieux répondre aux besoins des utilisateurs, on a restructuré et rationalisé la présente publication. Cette édition contient les séries de données que l'on considère comme les plus appropriées; toutes les séries publiées dans la version de 1971 ainsi que d'autres séries demandées par les utilisateurs paraîtront dans une série de documents de travail qui vous seront expédiés sous peu. Voici les principaux changements par rapport à l'année précédente qu'il faut retenir. Les séries de la main-d'oeuvre et les taux de chômage obtenus par sommation constituent maintenant la section 1; les séries de la main-d'oeuvre et les taux d'activité obtenus par ajustement direct ont été supprimés et paraîtront sous la forme d'un document de travail séparé. Enfin, les séries supplémentaires ajoutées à la publication de 1971 ainsi que les autres séries demandées seront publiées sous forme de documents de travail.

Les données non désaisonnalisées du présent bulletin sont fondées sur des renseignements obtenus au moyen d'une enquête fragmentaire faite auprès des ménages. Environ 30,000 ménages choisis par échantillonnage aréolaire dans tout le pays sont interviewés. L'enquête sur la main-d'oeuvre, inaugurée en novembre 1945, a été effectuée trimestriellement jusqu'en novembre 1952. Depuis lors, elle est effectuée tous les mois. Les estimations de l'emploi, du chômage et du nombre de personnes inactives portent sur une semaine déterminée chaque mois.

L'échantillon servant à l'enquête sur la main-d'oeuvre a été conçu de façon à représenter toutes les personnes âgées de 14 ans et plus qui habitent au Canada, exception faite des habitants du Yukon et des Territoires du Nord-Ouest, des Indiens des réserves, des pensionnaires des institutions et des militaires. Ces catégories exclues représentent environ 3 % de la population totale âgée de 14 ans et plus.

Les estimations tirées d'une enquête fragmentaire demeurent sujettes aux erreurs de sondage et aux erreurs non dues au sondage. Les différents aspects de cette question ainsi que les définitions et les explications relatives à l'enquête sur la main-d'oeuvre figurent dans la publication mensuelle intitulée La main-d'oeuvre, Statistique Canada, n° de catalogue 71-001F. Une description plus détaillée de l'enquête est faite dans le "Canadian Labour Force Survey, Methodology", Statistique Canada, n° de catalogue 71-504.

Les séries ont été traitées à l'aide de la version X-11 du United States Bureau of the Census Method II Seasonal Adjustment Computer Program(1).

Seasonally-adjusted labour force estimates may be obtained by direct adjustment or by summing seasonally-adjusted employment and seasonally-adjusted unemployment. In this report, the summation method has been used.

Seasonally-adjusted unemployment rates are always calculated by dividing the seasonally-adjusted unemployment by the sum of seasonally-adjusted employment and unemployment (i.e. seasonally-adjusted labour force by summation). Main series of unemployment rates, can be found in Section 1.

For each data series included in the contents of this publication, four tables have been presented as indicated below:

1. The unadjusted data. All estimates derived from the Labour Force Survey are rounded to thousands.
2. The final seasonal factors. Included in this table are forecast factors for the coming year.
3. The final seasonally-adjusted series. This table is obtained by dividing the unadjusted data for each month by the respective final seasonal factor.
4. The MCD moving average. This table presents the data for an unweighted moving average of the final seasonally-adjusted series. The term of the MCD average is determined by the period of time (not exceeding 6 months) required in order that the change in the final seasonally-adjusted series have a larger cyclical component than irregular component. Thus the MCD moving average represents the cyclical component of a data series, whereas the final seasonally-adjusted series contains both the cyclical and the irregular components.

(1) For a description of the technique see U.S. Bureau of the Census Technical Paper No. 15, "The X-11 Variant of the Census Method II Seasonal Adjustment Program".

Pour savoir quels sont les effectifs désaisonnalisés de la main-d'oeuvre, on peut procéder par ajustement direct ou par sommation de l'emploi désaisonnalisé et du chômage désaisonnalisé. Dans la présente publication on a fait appel à la seconde méthode en procédant par sommation.

Pour le calcul de tous les taux de chômage désaisonnalisés, on divise le nombre désaisonnalisé des chômeurs par la somme de l'emploi et du chômage désaisonnalisé (qui représente la main-d'oeuvre désaisonnalisée obtenue par sommation). Les séries principales de taux de chômage dont il est question ci-dessus figurent également dans la section 1.

Pour chaque série de données présentée, dans le présent bulletin, on trouvera quatre tableaux disposés dans l'ordre suivant:

1. Les données non désaisonnalisées. Toutes les estimations extraites de l'enquête sur la main-d'oeuvre sont arrondies au millier.
2. Les facteurs finals de désaisonnalisation. Le tableau indique également les facteurs prévus pour l'année à venir.
3. La série finale de données désaisonnalisées. On obtient le tableau en divisant chaque mois les données non désaisonnalisées par le facteur saisonnier final correspondant.
4. La moyenne mobile du mois de dominance cyclique (M.D.C.). Dans ce tableau, on trouvera les données sur la moyenne mobile non pondérée de la série désaisonnalisée finale. La moyenne M.D.C. est déterminée en fonction de la période de temps (jusqu'à concurrence de 6 mois) qu'il faut pour que la variation de la série désaisonnalisée finale comporte un élément cyclique plus important que l'élément irrégulier. Dans une série de données, la moyenne mobile M.D.C. représente donc l'élément cyclique, alors que la série désaisonnalisée finale comporte aussi bien l'élément cyclique que l'élément irrégulier.

(1) On trouvera une description de la méthode en question dans le document suivant: U.S. Bureau of the Census Technical Paper No. 15, "The X-11 Variant of the Census Method II Seasonal Adjustment Program".
